# Our Practise with NodeJS

### Practise 1 Tools

Macbook pro

**IDE** 

Mobile Framework

**Backend Skeleton** 

Human are tool builders.

### Practise 2 Promise

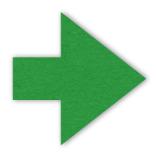

```
function _getWxJsapiTicketFromRedis() {
    var defer = Q.defer();
    redisq.getWxJsapiTicket()
        .then(function(jsApiTicket) {
            logger.de_ig('getWxJsapiTicketFromRedis', u.format('%s is retrieved from redis.', jsApiTicket));
if (logger.isLevelEnabled('DEBUG')) {
                 redisq.getWxJsapiTicketTTL()
                     .then(function(tt)).{
                         logger.debug(u.format('jspApiTicket time to live %d seconds.', ttl));
                     }, function(err) {
                         function(err) {
  logger.error('getWxJsapiTicketFromRedis', err);
            defer.resolve(jsApiTicket);
            return;
        }, function(err) {
            // no jsApiTicket in redis ?
            return _getWxAccessTokenFromRedis();
        .then( nction(accessToken) {
   if (accessToken)
                 return _getWxJsapiTicketByAccessToken(accessToken);
            return;
        }, function(err2) {
            // _getWxAccessTokenFromRedis throw an error
            logger.error('getWxJsapiTicketFromRedis', err2);
            defer.reject('_getWxAccessTokenFromRedis fail to resolve accessToken.');
        })
.then(function(result) {
            if (result) {
                // get new jsApiTicket
                 // TODO save into redis
                 // defer.resolve(result.ticket);
                 return redisq.setWxJsapiTicket(result);
            function(err3) {
// _getWxJsapiTicketByAccessToken throw an error
        }, function(err3) {
            logger.error(err3);
defer.reject(err3);
            return;
        .then(function(val) {
             * redisq.setWxJsapiTicket(result) fullfiled
             * @param {string}
             * @return {}
            if (val) {
                 defer.resolve(val);
        }, function(err4) {
            // setWxJsapiTicket throw an error
            logger.error(err4);
            defer.reject(err4);
        .done();
    return defer.promise;
```

### Practise 3 EventEmitter

### \_empEvent.emit(event, e);

```
// listening all patterns
_empEvent.on('*', function(event) {
    // logger.debug('on', event);
    setImmediate(_handleOnBehalf, event);
});
```

### Practise 4 Logging on the fly

log4js + EventEmitter

```
var dynamicLogging = new events.EventEmitter();
exports.getLogger = function(name) {
    var logger = log4js.getLogger(name);
    logger.setLevel(level);
    dynamicLogging.on("levelChange",function(newLevel){
        console.log(u.format("logger %s -- > Level : %s ", name, newLevel));
        logger.setLevel(newLevel);
    });
    return logger;
};
```
